## Listing of the Claims

1. (Original) A single sign-on authentication system, comprising:

an authentication component that determines whether a user is authenticated, and, if it is determined that the user is authenticated, generates a connection request;

an interface component that receives the connection request from the authentication component, the connection request including an identifier and entitlement information; wherein the interface component compares the received identifier with an expected identifier and, if they match, makes the entitlement information available to a server associated with the interface component,

wherein the interface component comprises a request processor configured to assign one or more resources accessible by the authenticated user, based at least in part on the entitlement information.

- 2. (Original) The single sign-on authentication system of claim 1, wherein the entitlement information is different from information used to authenticate the user.
- 3. (Original) The single sign-on authentication system of claim 1, wherein the identifier includes an Internet Protocol (IP) address.
- 4. (Original) The single sign-on authentication system of claim 2, wherein the authentication component determines the entitlement information based on the information used to authenticate the user.
- 5. (Original) The single sign-on authentication system of claim 4, wherein the information used to authenticate the user includes one or more of a user identifier and a password.
- 6. (Original) The single sign-on authentication system of claim 1, wherein the entitlement information is contained in a header portion of a data packet.

- 7. (Original) The single sign-on authentication system of claim 1, wherein the connection request is sent as an HTTP request.
- 8. (Original) A method for enabling an authenticated user to connect to a server in a computer network, comprising:

receiving a connection request for the authenticated user, the connection request including an identifier and entitlement information;

comparing the received identifier with an expected identifier; and making the entitlement information available to the server, only if the result of the comparison is a match.

- 9. (Original) The method of claim 8, wherein the entitlement information is different from information used to authenticate the authenticated user.
- 10. (Original) The method of claim 8, wherein the received identifier includes an Internet Protocol (IP) address.
- 11. (Original) The method of claim 9, wherein the entitlement information is determined based on the information used to authenticate the user.
- 12. (Original) The method of claim 11, wherein the information used to authenticate the authenticated user includes one or more of a user identifier and a password.
- 13. (Original) The method of claim 8, wherein the entitlement information is contained in a header portion of a data packet.
- 14. (Original) The method of claim 8, wherein the connection request is sent as an HTTP request.
- 15. (Original) A program storage device readable by a machine, tangibly embodying a program of instructions executable on the machine to perform method steps for enabling an authenticated user to connect to a server in a computer network, the method steps comprising:

Appl. No. 10/721,063 Attorney Docket No. 14846-32

receiving a connection request for the authenticated user, the connection request including an identifier and entitlement information;

comparing the received identifier with an expected identifier; and making the entitlement information available to the server, only if the result of the comparison is a match.
